

Understanding Directories

root directory or folder. Contains ALL files which will be uploaded. NOT ARCHIVES

this is a subdirectory. It exists inside the root folder. You can tell it is inside the other folder since it is indented. Every folder inside the main or root folder is a subdirectory.

using relative links, you would write a path from one file to the next, starting with the folder (directory) it is in. If it's in the same folder, just use the file name.

SO:

linking from cats.html to two.html would be
`click here for two`

linking from favorites.html to cats.html would be
`click here for cats`

linking FROM ONE.HTML in the phase 1 folder, to land.html in the root folder would be
`click here to go to land`
